

XprESS may be used to treat certain conditions affecting the sinus above your eyebrows and behind your cheeks. Your physician will need to determine if your condition is one that may benefit from XprESS. Possible side effects include but are not limited to post-operative bleeding, pain and swelling, allergic reaction to anesthesia or other medications administered during the procedure, or infection. Your condition may not respond to this treatment. To learn more about this procedure and the potential risks, ask your physician.

PATIENT INFORMATION

**XprESS™**

Multi-Sinus Dilation Tool

The Latest Advancement In  
**Balloon Sinus Dilation Technology**

## Breaking the Cycle

Patients with recurring or persisting sinus infections are typically treated with medications such as antibiotics, pain relievers, and steroid nasal sprays. For a time, patients typically feel better, but then the sinusitis symptoms return.

Now your doctor has a new way to break the sinusitis cycle without medication and without extensive surgery by using the latest advancement in minimally invasive balloon sinus dilation treatment.

### XprESS™: A New Advancement in Sinus Surgery

More and more physicians who perform sinus surgery use XprESS—the latest advancement in minimally invasive balloon sinus dilation treatment. The XprESS tool reopens blocked sinus drainage pathways using a small balloon. The use of XprESS can potentially reduce the amount of tissue loss as compared to traditional sinus surgery.<sup>1</sup>

### Are you Eligible for XprESS?

XprESS is designed to treat the symptoms most commonly experienced by many sinusitis sufferers. Your physician will determine if you are eligible for balloon sinus dilation using XprESS in a surgical setting or in an office procedure.

### How XprESS Works

Your physician will locate the area to be treated and position the XprESS device. Then they will inflate it and dilate the treatment area; after this the XprESS device will be removed.
